

DomStudio Social Media / Influencer Affiliate Roadmap

Draft v1 — 2026-07-01

0. Premise

One coordinator recruits and manages a roster of 10–30 people who have a social media following relevant to DomStudio's audience (WB/Ozon/Yandex/Avito sellers, plus the beauty/food/auto small-business verticals already built into the copy-tool suite). Each person in the roster gets a personal discount code. Customers who use that code get a discount; the person who owns the code earns a commission; the coordinator earns an override on top of the whole group's activity.

Commission structure (confirmed):

- **Coordinator: 15% override** — on all sales generated by every code in her group, paid on top, does not reduce anyone else's cut.
- **Influencer: 15% direct** — on sales generated by their own personal code.
- **Customer: 15% off first purchase** — locked for Phase 1 so the pilot has clear unit economics before codes go live.

1. What already exists vs. what needs to be built

DomStudio already has a referral system (commit 67c34e5, live) that is **structurally close** to what this program needs but solves a different problem:

- `referral_code` — an 8-char code every user already has (`database.py`, `routers/auth.py`)
- `referred_by_code` — set at registration if someone signed up through a link
- Reward: flat **+500 tokens** to both sides on first verification — no percentage discount, no percentage commission, no two-level hierarchy (coordinator → influencer → customer), no cash payout ledger

That system is for casual user-to-user invites. It cannot be reused as-is for this program because it has no concept of a discount percentage, a commission percentage, or a parent/child code relationship. But the schema pattern (a code table + attribution on signup/checkout) is the right shape to extend rather than replace.

New backend work required:

- 1 `promo_code` table: `code`, `owner_label` (influencer name/handle — these people will often not be registered DomStudio users), `parent_code` (nullable — set for influencer codes, points at the coordinator's master code), `discount_percent`, `commission_percent`, `active`
- 2 Checkout flow (`routers/payments.py`) needs to accept an optional promo code, apply the discount to `price_rub` before charging Tinkoff, and record which code was used against the resulting payment
- 3 Commission ledger: `payment_id`, `code`, `base_amount_rub`, `commission_rate`, `commission_amount_rub`, `payee`, `payout_status` — two rows get written per qualifying sale (the influencer's 15% row, and the coordinator's 15% override row on the same sale)
- 4 Reporting: a plain internal view (Supabase table browser is enough at this volume — 10-30 codes) rather than a customer-facing dashboard. Build a real dashboard only if/when this scales past manual tracking.

This is new backend work, not a copy-paste of the existing referral system. Budget it as its own small feature rather than assuming it rides for free on top of 67c34e5.

2. Roles

Coordinator

- Recruits and manages the roster (target 10–30 people)
- Gets one master code that every influencer's code is a child of
- Earns 15% override on every sale attributed to any code in her group
- Owns onboarding: hands each influencer their code, a short pitch deck, and sample post copy (see §6)

- Single point of contact for reporting questions — she should not need backend access; a monthly summary is enough

Influencers (10–30 people)

- Each gets one unique code + shareable link
- Posts about DomStudio's actual, live capabilities — see §3 for what's safe to claim
- Customer using their code gets the agreed discount on first purchase; influencer earns 15% of that purchase
- Recommend capping the commission window to **first purchase only** (not lifetime recurring), to keep payout liability predictable while the program is unproven

3. What influencers are allowed to claim (honesty guardrail)

This pulls directly from the standing project rule: **be honest, don't oversell a mode past what it actually does**. Concretely, for this audience:

Claim	Status	Notes
"AI cleans up your product photos for marketplace listings"	Safe	Catalog mode — live, verified
"AI puts your product in a real scene / lifestyle shot"	Safe	Product/lifestyle img2img — live, product identity preserved
"AI writes your Avito/Ozon/WB/Yandex Maps listing copy"	Safe	14 copy tools across beauty/food/auto verticals — live
"AI generates video for your listing"	Careful	WanVideo pipeline works on the Turing GPU box but is not the default always-on path — confirm current status before an influencer promises "video" in a post; do not let anyone imply a still image with pan/zoom is a video
"Virtual try-on"	Careful	Only claim this if the fitting workflow being demoed is the real virtual try-on model, not generic image edit

Give each influencer 2-3 short example posts using real before/after assets already in temp-preview/ / the curated gallery, not stock claims.

4. Unit economics and pilot rules

These rules are locked for Phase 1 so the program can launch without fuzzy money math:

- **Customer discount:** start at **15%** for the pilot, not 20%.
- **Commission base:** calculate influencer and coordinator commission from the **actual paid amount after discount**, not the original list price.
- **Commission window:** commission applies to the customer's **first paid purchase only**, not lifetime recurring spend.
- **Stacking:** one promo code per customer purchase; promo codes cannot stack with other discounts or referral bonuses.
- **Self-referral:** influencers, the coordinator, and internal test accounts cannot earn commission on their own purchases.
- **Controls:** every code needs active, starts_at, and optional expires_at / paused_reason fields so a code can be shut off quickly.

The pilot should be judged as paid acquisition spend. With a 15% customer discount, 15% influencer commission, and 15% coordinator override, the maximum first-purchase acquisition cost is 45% of the post-discount paid amount before payment fees and AI generation costs. That is acceptable only because the commission window is first-purchase-only and the first pilot is capped at 3-5 influencers.

5. Discount code mechanics

- Customer applies code at checkout → gets 15% off first purchase (**15% for Phase 1**) before Tinkoff payment is created

- Code is tied to one influencer; influencer's code is tied to the coordinator's master code for the override
- First purchase only, per customer; prevent stacking, reuse, and self-referral
- Track: signups via code, first purchase via code, discount given, commission owed (influencer + coordinator rows)
- Track funnel performance per code: signup, checkout started, paid, refunded, commission pending, commission approved, commission paid

6. Recruitment plan for the coordinator

- She sources candidates from her own network first — target people whose audience already includes WB/Ozon/Avito sellers, or beauty/food/auto small-business owners (this maps directly onto the 3 verticals already live in the copy tools)
- Give her a one-page pitch covering: what DomStudio does, the discount the customer gets, the 15% the influencer earns, and 2-3 real before/after examples
- Each influencer, once recruited, gets: their code + link, the honesty guardrail table above, and 2-3 sample captions in Russian

7. Content cadence template (per influencer, repeatable monthly)

Week	Post type
1	Before/after catalog cleanup (real product photo)
2	Lifestyle/product-in-scene shot
3	Copy-tool demo — screenshot of an AI-written listing for their niche (beauty/food/auto)
4	Discount code reminder / short testimonial

Vertical short-form (Stories/Reels format) can slot into any week once the video pipeline status is confirmed current — don't schedule a video post in the template until that's verified live, per the honesty guardrail.

8. Payout logistics

- Calculate monthly, from the ledger in §1, using the post-discount paid amount as the commission base
- Pay influencers directly for their 15%; pay the coordinator her 15% override as a separate line, not netted through the influencers
- Set a minimum payout threshold (e.g. skip payout below some small ruble amount, roll it to next month) to avoid micro-transfers
- Flag for the user: paying individuals in Russia for this kind of commission work generally implies self-employed (самозанятый) status on their side — worth confirming how payouts will be documented before scaling past the pilot, this is an administrative/tax question for the user to resolve, not something to route around

9. Rollout phases

Phase 0 (now): Structure agreed (this doc). Coordinator briefed.

Phase 1 (pilot, ~2 weeks): Build the promo-code + ledger backend (§1 and §4). Issue codes to a small pilot group (3-5 influencers) before the full 10-30, so the discount, commission math, anti-abuse rules, and checkout integration get a real test with low exposure.

Phase 2 (full rollout): Once pilot numbers look sane, onboard the rest of the 10-30 roster. Content calendar (§7) starts in earnest.

Phase 3 (month 2+): Review conversion rate and margin impact per code. Adjust discount % or commission % if the unit economics are off. Consider a lightweight self-serve reporting view for the coordinator only if manual tracking becomes the bottleneck.

Phase 1 build order

- 1 Add promo_code storage with parent-code support and active/pause fields.
- 2 Add checkout promo validation and 15% discount calculation.
- 3 Store the promo code and paid amount on successful payment.
- 4 Write two commission-ledger rows after successful payment: influencer 15% and coordinator 15%.
- 5 Add a simple internal report/export for signups, paid purchases, discounts, and payout status.

Open decision before Phase 1 can start

- No product decision is still blocking Phase 1. The remaining open item is administrative: confirm how influencer and coordinator payouts will be documented before paying the first monthly commission batch.
